1. Introduction

In this report, we will explore the various factors that influence *fluid dynamics* in glaciers and how they contribute to the formation and behaviour of these natural structures.

1. The climate
   - Temperature
   - Precipitation
2. The topography
3. The geology

There is a cat shown in Figure 1. But more will be shown in Section 2. Here is a test how the show function changes SMS group. Wow, this is pretty cool!

Figure 1: *Cats* read english books.

2. Methods

We follow some thing and then cite it. As written in [1]. The equation $Q = \rho A v + C$ defines glacial flow rate. The flow rate of a glacier is defined by the following equation:

$$Q = \rho A v + C$$

This seems to be truly awesome with Typst.

$$7.32\beta + \sum_{i=0}^{\nabla} \frac{Q_i(a_i - \varepsilon)}{2}$$

Then, there are vectors:

$$v := \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}.$$

The syntax seems to be easier compared to LaTeX.

$$a \rightsquigarrow b$$

2.1. Background

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor.

2.2. Methods

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore.
